WHAT IS YOUR BLUEPRINT FOR FLY CONTROL? PROTECT YOUR HERD AGAINST HORN FLIES

It's a fact. Cattle that are bunched up and stressed from the constant biting of horn flies are not grazing and gaining as they should be. The ideal horn fly control program starts with adding Altosid® IGR into your feed supplement 30 days before fly emergence to manage flies that have overwintered. Continue to use Altosid IGR throughout summer and into fall, 30 days after the first frost in order to help prevent any remaining horn flies from overwintering. Using Altosid® IGR as the cornerstone of your horn fly management program will yield positive returns for your cattle and your bottom line. Altosid® IGR is smarter fly control, built by science.

The mechanics of controlling horn flies

Altosid IGR is an insect growth regulator (IGR) that passes through the animal and into the manure, where horn flies lay their eggs. It breaks the horn fly life cycle by preventing pupae from developing into biting adult flies.

Ask your Hubbard dealer about these proven fly control products—and start feeding before the horn flies appear!

Blueprint® Cattle Mineral Altosid (#62423)*

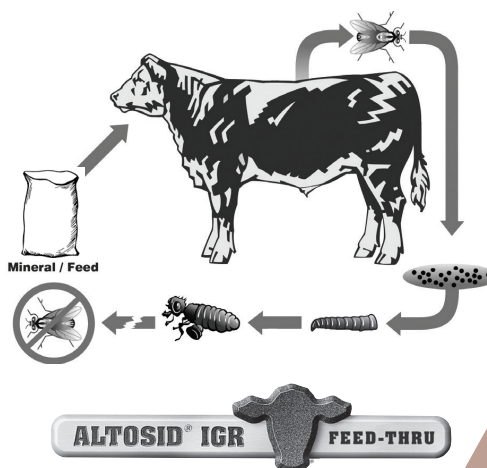

The “workhorse” of the Blueprint family of products. Comes with the added benefit of fly control for stock cows, replacement heifers and yearling steers

Blueprint® Fescue Mineral Altosid (#62425)*

Contains FEB-200 C and fits well in areas where cattle are grazing fescue pastures. Also provides much-needed fly control during warmer months

To learn more about Altosid IGR, contact your local Hubbard Feeds representative, call 1-800-869-7219, or visit us online at HubbardFeeds.com or AltosidIGR.com.
